

# gdb cheatsheet

---

## Starting GDB

| Command                                                 | Description                                   |
|---------------------------------------------------------|-----------------------------------------------|
| <code>gdb &lt;program&gt;</code>                        | Start GDB.                                    |
| <code>gdb &lt;program&gt; [core dump]</code>            | Start GDB with an optional core dump.         |
| <code>gdb --args &lt;program&gt; &lt;args...&gt;</code> | Start GDB and pass arguments.                 |
| <code>gdb --pid &lt;pid&gt;</code>                      | Start GDB and attach to a process.            |
| <code>set args &lt;args...&gt;</code>                   | Set arguments for the program to be debugged. |
| <code>show args</code>                                  | Show current arguments.                       |
| <code>run</code>                                        | Run the program.                              |
| <code>start</code>                                      | Run and stop at <code>main</code> .           |
| <code>kill</code>                                       | Kill the running program.                     |
| <code>quit</code>                                       | Exit GDB.                                     |

## Breakpoints

| Command                                  | Description                                        |
|------------------------------------------|----------------------------------------------------|
| <code>break &lt;where&gt;</code>         | Set a new breakpoint.                              |
| <code>break file.cpp:42</code>           | Break at a source line.                            |
| <code>break function_name</code>         | Break at function entry.                           |
| <code>break Class::Method</code>         | Break at class member function entry.              |
| <code>break *0x00001234</code>           | Break at a code address.                           |
| <code>delete &lt;breakpoint#&gt;</code>  | Remove a breakpoint.                               |
| <code>clear</code>                       | Delete all breakpoints.                            |
| <code>clear file.cpp:42</code>           | Delete breakpoints at a line.                      |
| <code>enable &lt;breakpoint#&gt;</code>  | Enable a disabled breakpoint.                      |
| <code>disable &lt;breakpoint#&gt;</code> | Disable a breakpoint.                              |
| <code>info breakpoints</code>            | Show breakpoints and watchpoints.                  |
| <code>set breakpoint pending on</code>   | Allow unresolved breakpoints for future libraries. |

## Watchpoints and conditions

| Command                                                      | Description                                            |
|--------------------------------------------------------------|--------------------------------------------------------|
| <code>watch &lt;where&gt;</code>                             | Set a new watchpoint.                                  |
| <code>watch variable_name</code>                             | Break on write.                                        |
| <code>rwatch variable_name</code>                            | Break on read.                                         |
| <code>awatch variable_name</code>                            | Break on read or write.                                |
| <code>break/watch &lt;where&gt; if &lt;condition&gt;</code>  | Conditional breakpoint or watchpoint.                  |
| <code>condition &lt;breakpoint#&gt; &lt;condition&gt;</code> | Set or change the condition of an existing breakpoint. |
| <code>ignore &lt;id&gt; 5</code>                             | Ignore the next five hits.                             |
| <code>commands &lt;id&gt; ... end</code>                     | Run commands when a breakpoint hits.                   |

## Stack and stepping

| Command                                  | Description                                               |
|------------------------------------------|-----------------------------------------------------------|
| <code>backtrace / where</code>           | Show the call stack.                                      |
| <code>backtrace full / where full</code> | Show call stack with local variables.                     |
| <code>frame &lt;frame#&gt;</code>        | Select a stack frame.                                     |
| <code>up / down</code>                   | Navigate stack frames.                                    |
| <code>step</code>                        | Go to the next source line, diving into functions.        |
| <code>next</code>                        | Go to the next source line without diving into functions. |
| <code>finish</code>                      | Continue until the current function returns.              |
| <code>continue</code>                    | Continue normal execution.                                |

## Variables and memory

| Command                                  | Description                                          |
|------------------------------------------|------------------------------------------------------|
| <code>print/format &lt;what&gt;</code>   | Print variable, memory, or register content.         |
| <code>print variable</code>              | Print a variable value.                              |
| <code>print *ptr</code>                  | Dereference a pointer.                               |
| <code>print *arr@N</code>                | Print N array entries starting at <code>arr</code> . |
| <code>display/format &lt;what&gt;</code> | Print after each step or stop.                       |
| <code>display variable</code>            | Auto-print at each breakpoint or stop.               |
| <code>undisplay &lt;display#&gt;</code>  | Remove a display entry.                              |

| Command                                                                         | Description                       |
|---------------------------------------------------------------------------------|-----------------------------------|
| <code>enable display &lt;display#&gt; / disable display &lt;display#&gt;</code> | Toggle display entries.           |
| <code>x/nfu &lt;address&gt;</code>                                              | Print memory.                     |
| <code>x/[COUNT][SIZE][FMT] &lt;address&gt;</code>                               | General memory inspection syntax. |
| <code>info proc mappings</code>                                                 | Show process memory layout.       |

## x modifiers

| Part   | Meaning                                                                                                                                                                                          |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count  | How many units to print; comes first if used.                                                                                                                                                    |
| Size   | <b>b</b> byte, <b>h</b> half-word, <b>w</b> word, <b>g</b> giant word.                                                                                                                           |
| Format | <b>a</b> , <b>c</b> , <b>d</b> , <b>f</b> , <b>o</b> , <b>s</b> , <b>t</b> , <b>u</b> , <b>x</b> , <b>i</b> for pointer, char, signed, float, octal, string, binary, unsigned, hex, instruction. |

## Useful <what> forms

| Form                                  | Meaning                                                                                    |
|---------------------------------------|--------------------------------------------------------------------------------------------|
| <code>expression</code>               | Almost any C expression; function calls may need an explicit cast.                         |
| <code>file_name::variable_name</code> | Static variable from a file scope.                                                         |
| <code>function::variable_name</code>  | Variable from a function scope, if available.                                              |
| <code>{type}address</code>            | Interpret memory at address as a given C type.                                             |
| <code>\$register</code>               | Register content such as <code>\$esp</code> , <code>\$ebp</code> , or <code>\$eip</code> . |

## Sources and TUI

| Command                                                | Description                                                 |
|--------------------------------------------------------|-------------------------------------------------------------|
| <code>directory &lt;directory&gt;</code>               | Add a source directory.                                     |
| <code>show directories</code>                          | Show configured source directories.                         |
| <code>list</code>                                      | Show current source context.                                |
| <code>list &lt;filename&gt;:&lt;function&gt;</code>    | Show source around a function.                              |
| <code>list &lt;filename&gt;:&lt;line_number&gt;</code> | Show source around a line.                                  |
| <code>set listsize &lt;count&gt;</code>                | Set the number of source lines shown by <code>list</code> . |
| <code>show listsize</code>                             | Show the current <code>list</code> line count.              |
| <code>gdb --tui &lt;program&gt;</code>                 | Start with text UI enabled.                                 |

| Command                                          | Description                 |
|--------------------------------------------------|-----------------------------|
| <code>tui enable</code>                          | Enable TUI from inside GDB. |
| <code>layout src, layout asm, layout regs</code> | Select common TUI layouts.  |
| <code>layout prev / layout next</code>           | Cycle layouts.              |
| <code>tui focus &lt;layout&gt;</code>            | Focus a TUI pane.           |

## Information commands

| Command                                              | Description                               |
|------------------------------------------------------|-------------------------------------------|
| <code>info args</code>                               | Show current frame arguments.             |
| <code>info locals</code>                             | Show current frame locals.                |
| <code>info display</code>                            | Show display expressions.                 |
| <code>info sharedlibrary</code>                      | List shared libraries.                    |
| <code>info signals</code>                            | List signals and their behavior.          |
| <code>info threads</code>                            | List threads.                             |
| <code>whatis variable_name</code>                    | Show variable type.                       |
| <code>ptype MyClass</code>                           | Show class or struct details.             |
| <code>disassemble / disassemble &lt;where&gt;</code> | Disassemble current or selected location. |

## Signals and manipulation

| Command                                            | Description                                          |
|----------------------------------------------------|------------------------------------------------------|
| <code>handle &lt;signal&gt; &lt;options&gt;</code> | Configure whether a signal prints, stops, or passes. |
| <code>handle SIGSEGV stop print</code>             | Stop and print on SIGSEGV.                           |
| <code>handle SIGPIPE nostop noprint pass</code>    | Pass SIGPIPE to the program.                         |
| <code>handle SIGUSR1 nopass</code>                 | Catch SIGUSR1 and do not pass it on.                 |
| <code>signal SIGUSR1</code>                        | Send a signal to the inferior.                       |
| <code>set var &lt;name&gt;=&lt;value&gt;</code>    | Change a variable value.                             |
| <code>set variable x = 10</code>                   | Alternative variable assignment form.                |
| <code>set \$rax = 0</code>                         | Change a register value.                             |
| <code>return &lt;expression&gt;</code>             | Force current function to return immediately.        |
| <code>jump file.cpp:100</code>                     | Jump execution to another source line.               |
| <code>call function(args)</code>                   | Call a function manually from GDB.                   |

## Threads, tracepoints, reverse, Valgrind

| Command                                                                            | Description                             |
|------------------------------------------------------------------------------------|-----------------------------------------|
| <code>thread &lt;thread#&gt;</code>                                                | Choose a thread to operate on.          |
| <code>thread apply all &lt;command&gt;</code>                                      | Execute a command across all threads.   |
| <code>break file.cpp:42 thread 3</code>                                            | Break only in thread 3.                 |
| <code>trace function_name / trace file.c:42</code>                                 | Create a tracepoint.                    |
| <code>actions / collect \$regs,\$locals,myvar / end</code>                         | Define tracepoint data collection.      |
| <code>passcount 100 1</code>                                                       | Stop after collecting 100 hits.         |
| <code>tstart, tstop, tfind, tdump, tstatus, tsave, target tfile</code>             | Trace collection and analysis workflow. |
| <code>record full</code>                                                           | Enable recording for reverse debugging. |
| <code>reverse-step, reverse-next, reverse-continue</code>                          | Move backward through execution.        |
| <code>valgrind --vgdb=yes --vgdb-error=0 --vgdb-stop-at=startup &lt;app&gt;</code> | Start Valgrind in GDB-connectable mode. |
| <code>`target remote</code>                                                        | vgdb`                                   |
| <code>monitor leak_check / monitor v.info location &lt;addr&gt;</code>             | Query Valgrind state from GDB.          |
